Abstract

Growing quest for globalization and expanding economies have resulted into fragmentation, enclosure, grabbing, militarization and devastation of rangelands. Grasslands – covering 70% of the global agricultural area – are the basis for livestock production. In most of the countries, governments have little recognition of communal tenures of agro-pastoralists. Consequently, both pastoralists and rangeland ecosystems have suffered a grim fate. On the contrary, the subsistence pastoralism is an established sustainable strategy of livelihood and ecosystem conservation in the rangelands. Unfortunately, some of the most nutritive foods and other sustainable products of nomadic pastoralists have not desirably been priced in modern markets. With the demonstrated cases exhibiting the nomadic pastoralists, such as Hutsul shepherd communities of Ukraine, as most sustainable societies on planet Earth, there is urgent need for reshaping the popular paradigm and State policies on rangeland commons. In isolation of pastoralist people, the rangelands cannot truly be conserved or protected. To begin with, the resilience of pastoralists to the changing environments and their (unique) rangeland management can first be pondered. Accordingly, the policy and legal frameworks of States need to be reoriented and revised. In particular, Eurasian countries should review their laws and policies on rangeland sustainability and pastoral grazing.

Keywords

Pastoralists; Rangelands; Enclosure; Hutsul; Grasslands; Inequity; Mobility; Fragmentation

1. Introduction

The grasslands – covering 70% of the global agricultural area – are the basis for livestock production. The livestock is the fastest growing agricultural sector in many countries. Revolving around livestock raising, nomadic or mobile pastoralism lifestyle is evidently a sustainable livelihood having ability to move and manage risk in marginal landscapes. Growing quest for globalization and expanding economies have first resulted into fragmentation, enclosure, grabbing, militarization and devastation of rangelands. With the help of weak rangeland or pastures related laws/policies and by using powerful land acquisition or conversion laws/policies, countries either have given up massive rangeland

territories to other forms of land uses or enclosed tenures or have restricted/circumvented the grazing activities of pastoralist herders. This has affected the sustainability of both rangeland ecosystem services and viable pastoralism and transhumance. Nowhere in the world do pastoralist peoples have the power to prevent their land being alienated, and hence these communities are excluded from their livelihoods and lifestyles. In most of the countries, rangelands are chiefly owned or controlled by governments with little recognition of communal tenures of agro-pastoral communities and their custodianship of local governance institutions. For example, following the land reform in the country, the Land Code of Ukraine 2001 (amended 2017) recognizes only three types of agricultural lands: corporate farms, peasant farms and household plots. Common property resources owned and collectively used by graziers and other poor communities do not exist at all. Communal tenure of lands was suspended or converted into private land tenure systems. Similar phenomenon has occurred in majority of the countries world over.

To save and revive the sustainable livelihoods and lifestyles of agro-pastoralists and nomadic livestock raisers, Eurasian countries should review and revise their pertinent laws, policies and governance frameworks for locating the strong loci and weak dots in relation to rangeland sustainability and pastoral grazing. A paradigm shift is required not only for academics or government, but it is equally need for civil society or citizen groups. This article is aimed at analysing the needs of such a paradigm shift and fundamental change in the policy and legal orientation in different States.

2. Brief Review of Literature

Empirical studies demonstrating that pastoralism is more productive per hectare than commercial ranching or sedentary livestock keeping in similar environmental conditions have been conducted by large number of scientists (Hesse, 2009; Simel, 2009). Similarly resilience and adaptability of the pastoralists has widely been described by Dyson-Hudson & Dyson-Hudson (1980), Chatty & Sternberg (2015), Farming Matters (2016), McCabe (1997), Galaty & Johnson (1990), Næss (2004), Roe et al. (1998), Homewood (2009) and UNOCHA (2007). On the issues of rangeland enclosure, grabbing, land use change, fragmentation of landscape, habitat loss and effect on sustainability of livelihoods various authors have documented. Among them certain are: Reid et al. (2003), Mhangara & Kakembo (2012), FAO (2007), Herold et al. (2003), Turan et al. (2010), Barnes et al. (1991). Certain scholars strongly advocated for the policy reform addressing rangelands and pastoralism in general contexts and in particular contexts of former USSR countries. Such references include Blench & Sommer (1999), Blench (1999), Isaeva & Shigaeva (2017), Crewett (2015), Dorre (2015) and Shigaeva et al. (2016). However, an advocacy for a complete policy paradigm shift is missing in the policy debate especially from the perspective of reversing the vision of conservation science, land use planners, global economics architects and anti-nomadism State.

3. Rangelands and Pastoralism: Why do the Pastoralists Matter?

About half (6,700 million ha) of the Earth's land surface is covered by the scanty vegetation associated with natural rangelands (Groombridge, 1992; Moore, 1970; Solbrig, 1996). Majority of the land surface of planet Earth is used for grazing (Reid et al., 2008). The land where most herding peoples and livestock make a living are characterized as open grazing lands, including savannahs, grassland, prairies, steppe and shrub lands (Neely et al., 2009). It is estimated that grazing lands cover 61.2 million km² or 45% of the Earth's surface (excluding Antarctica), 1.5 times more than forests, 2.8 times more than cropland, and 17 times more than urban settlement (Næss, 2013). The grasslands – the basis for livestock production – cover about 70% of the global agricultural area (Næss, 2013). The livestock is the fastest growing agricultural sector, and in some countries, it accounts for 80% of gross domestic product (Neely et al., 2009). It is aptly estimated that more than one billion people depend on livestock, and

70% of the 880 million rural poor living on less than US\$ 1 per day are at least partially dependent on livestock (Neely et al., 2009). Nomadic and transhumant pastoralists may number 100-200 million people globally¹. The pastoralists are found in many parts of the world, including Africa, Central Asia, the Arctic, and southern & eastern Europe. The main livestock species kept by pastoralists are cattle, donkeys, goats and sheep, although they also keep, e.g., alpaca and llamas in the Andes, camels and horses in east-central Asia, the dromedary in Africa and West Asia, reindeer in northern Eurasia, and yak on the Tibetan Plateau and northeast India (Reid et al., 2008).

Scientifically, it is demonstrated that pastoralists and pastoralism make significant contributions to local, national and regional economies. Simel (2009) and Hesse (2009) demonstrated that pastoralism is considerably more productive per hectare than commercial ranching or sedentary livestock keeping in similar environmental conditions, and that the high productivity of livestock in pastoral systems not only supports millions of pastoralists but also contributes significantly to other sectors of national and regional economies (Hesse, 2009; Simel, 2009). The economists have estimated that pastoralists produce 10% of the world's meat, supporting nearly 200 million pastoral households who raise about 1 billion head of camel, cattle and smaller livestock (Nori et al., 2008). Besides, the economic contribution of pastoralism, it is essential to understand how pastoralism differs from other lifestyles. Dyson-Hudson & Dyson-Hudson (1980) conceptualized nomadic pastoralism as the coexistence of dependence on livestock with spatial mobility. Others narrate that the nomadic or mobile pastoralism has long been a sustainable livelihood in a diverse range of countries because of herders' ability to move and manage risk in marginal landscapes where domesticated animals efficiently convert limited ecological productivity into sustenance (Chatty & Sternberg (2015). Pastoralists exert control over their animals based on their preferences for livestock's products they make a living of either directly, or indirectly, through the usage of products from domesticated animals (Spooner, 1973). Extensive livestock grazing is an excellent example of managing biodiversity and soil fertility. For example, through the transport of seeds and insects by livestock, the migration of pastoralists and their flocks supports habitat connectivity and biodiversity (Farming Matters, 2016). The mobile and less intensive use of natural resources is usually a better and more sustainable way to use nature, especially in fragile environment such as rangelands.

The pastoralism is usually the optimal subsistence pattern in critical ecosystems because it allows considerable independence from any local environment. When there is a drought, pastoralists disperse their herds or move them to new areas. On the contrary, farmers rarely have such options. They suffer crop failure and starvation in the same situation. A pastoral subsistence pattern reduces the risk when there is an irregular climatic pattern². Thus, the key to pastoralism is mobility, which permits temporary exploitation of resources that are not sufficient to sustain a human and herbivore population for an entire year³. A host of features of nomadic life reflect the demands and costs of mobility and of dependence on herds of animals [to convert the energy stored in grasses to the milk, meat and wool] that feed the human population. So, pastoralist societies commonly develop a conscious and explicit nomadic ethos, which values mobility and the ability to cope with problems by moving away from threats or toward resources and which disparages permanent settlement, cultivation of the soil, and accumulation of objects⁴.

Adaptation strategies adopted by nomadic pastoralists are talked high by scientists. According to McCabe (1971), pastoral management strategies are best understood as rigged towards risk aversion rather than strategies that emphasize maximization.

Galaty & Johnson (1990) rightly articulate: "The essential pastoral strategy is probably neither maximization nor optimization, but risk aversion, which is an attempt to decrease uncertainty by anticipation. Domestic security is increased through creating alliances across ecological zones, distributing livestock among friends, securing rights in dry season pastures, increasing herds in anticipation of future losses. Short term tactics include punctuated movements to take advantage of new grass, depriving humans of milk to feed calves, or keeping animals within the home to increase security." Therefore, pastoral strategies are not viewed so much as directed towards maximizing animal numbers, but rather directed primarily towards securing a predictable food supply in a highly unpredictable environment (Næss, 2004). Roe et al. (1998) argue: "[...] that the central concern of pastoralist is to manage a predictably unpredictable environment better, so as to establish a *reliable* flow of life-sustaining goods and services from rangeland ecosystems that are in fact an endogenous part of their production system." Moreover, the pastoralists are believed to be the experts at maximizing the use of rangelands, a capability demonstrated by numerous research studies (UNOCHA, 2007). According to Homewood (2009), the pastoralists are only able to utilize marginal lands and they take only temporary advantage of richer areas with high rainfall, high nutrient forage or both.

4. Case of Mobile Pastoralists in the Mediterranean Region

Evolved as socio-cultural and biocultural diversity heritage, the mobile pastoralism involves transhumance across extreme environments while herding animal flocks for accessing and exchanging products and services, seizing ecosystemic opportunities, and evading animal diseases or other risks. About 26 million km² of land (nearly 25%) worldwide are under managed-grazing systems engaging about 120 million pastoralists/agro-pastoralists worldwide, with about 31 million in southern Mediterranean region (Nori, 2019). At present, people in the developed world obtain 27% of calories and 56% of protein from animal sources. According to an estimate, livestock products contribute 17% calories and 33% protein globally to the world's diets (Nori, 2019). FAO data indicate that human-edible protein from livestock is produced much more efficiently where the sector is dominated by pastoralism. This highlights the comparative advantage for livestock production in pastoral systems over intensive industrial livestock production (Blench, 2001). Sheep and goats provide milk being used as fresh milk, sour milk, yoghurt, ghee, cheese and "Jameed" (Beduin-Jordanian food made from goat milk). Cattle provide milk being consumed fresh or used to produce ghee and sour milk. Camel's milk is consumed fresh and as sour "Qaress" (Daoud et al., 2016). Nevertheless, sustainable livestock production (such as through mobile pastoralism) is able to provide enough animal products for healthy human diets (with high-quality protein), especially when red meat has received health risk alerts. Animal food quality is another important aspect. Evidently, mobile livestock is less affected by animal diseases. Livestock, especially local/native breeds, reared in the open air and fed on natural pastures is more likely to be fit and resistant to diseases. As a result, the meat, milk and other derived products are of high quality, more secure, and healthier. Evidences exist that pasture-fed animal products consistently yield a better nutritional profile: healthier lipidic composition, higher content of polyunsaturated fatty acids (PUFAs) or conjugated linoleic acids (CLAs), or higher Omega 3 content (better Omega 6/ Omega 3 balance), low iodine content, etc. (Daoud et al., 2016).

In Mediterranean ecoregion, pastoralism has played a key role in shaping arid and mountainous landscapes characterized by highly unpredictable rain patterns and high climatic variability. In southern Mediterranean, livestock trade and marketing are also important economic drivers, as the demand for animal protein consumption has grown steadily since the 1960s. In Mediterranean region, small ruminants (sheep, goats) mostly compose the livestock, along with certain proportion of cattle, equines and camels. For example, in Greece, out of 20 dairy-farming products (cheeses) 18 are made of sheep and

goat milk (Hadjigeorgiou, 2011). Likewise, meat production in southern Mediterranean increased from 5 million metric ton in 1983 to 15 million metric tons in 2020. Similarly, milk consumption was 223 million metric tons higher in 2020 compared to 1993 (Nori, 2019). However, we see stark differences in southern Mediterranean (mostly arid and plateaus landscapes) and northern Mediterranean (mostly highland landscapes) where number of livestock has increased in the former and decreased in the latter. In southern Mediterranean, livestock population (cattle, camels, sheep, goat), especially small ruminants, has got more than doubled in 40 years (from 1967 to 2007) counting from 207.5 million heads to 430.3 million heads. Economic reasons, human population growth, oil wealth, advancing urban life, policy favours, subsidies, and higher per capita consumption are certain reasons behind this scramble (Nori, 2019). On the contrary, northern Mediterranean countries, such as Greece, Spain, Italy, France, etc. witness a decline in population of sheep and goats. For example, sheep in Italy decreased from 1.1293 million heads in 1985 to 0.7285 million heads in 2016 (Nori, 2019). But the average sheep farm size has increased between 1990 and 2020, which means intensification process has gained momentum under various complex reasons including EU's Common Agriculture Policy. Scientific research indicates that when industrial livestock production has increased by 4.3%, mixed farming and extensive livestock grazing have increased 2.2% and 0.7%, respectively, reflecting that the preference is given to the openly grazed animals for meat consumption (Nori, 2019).

The Mediterranean region has pastoralism with embedded local cultures and landscapes – mountains, drylands, coastal basins. Mobile pastoralism, as a major traditional cultural practice in the Mediterranean, is dating as far back as 10,000 years (Daoud et al., 2016). It is a unique example of a mosaic of biological and cultural components evolved over centuries. This innate interaction has shaped traditional Mediterranean landscapes and produced innumerable cultural manifestations, such as traditional farmhouses, huts, watering points, cultivated terraces, bridges, stone walls, hermitages and monasteries. Countless rural architectural features form part of a material heritage having a physical expression of ancient relationship between nature and humankind. The creation and maintenance of local animal breeds is classical way in which their practice contributes to maintaining cultural heritage (Daoud et al., 2016). Therefore, immaterial heritage of pastoralism in the region is exceptional having countless manifestations of folklore, local agroecosystems, traditional ecological knowledge, cultural practices, art, traditional celebrations, gastronomy, poetry, etc. Despite massive contributions to regional economics and Mediterranean diets, the heritage of pastoralism is under pressure and threat from a number of challenges. Inherently, pastoralism is a 'slow response' system; the reproductive cycle of livestock is not adapted to making major changes over a short period (Johnsen et al., 2019). For example, if the price of dairy products falls dramatically, a herd cannot be suddenly switched into meat production. The challenges of eroding commons, fragmenting rangelands, State enclosures, tenurial uncertainties, shifting occupations, climate change, erring policies, restrictive regulations, globalized market systems, inter-community conflicts and militarization will be discussed.

5. Enclosure of Rangelands and Pastoralism

The scientists and managers have rarely conducted observational or experimental studies on habitat loss or fragmentation caused by human action in rangelands (Reid et al., 2013). Landscape fragmentation may be defined as processes in which large continuous cover is subdivided into a number of smaller patches of smaller total area that are isolated from each other by a matrix of habitats (Mhangara & Kakembo, 2012). These patches are unlike the original (FAO, 2007). Some of the effects of fragmentation on landscape structure are: a decrease in the overall amount of habitat and mean patch size, incrementing of the edges, decrease of the core area and isolation of the habitat patches (FAO, 2007; Herold et al., 2003; Turan et al., 2010). According to scholars, the very process of destruction or reduction in the quality of part of a habitat also breaks

the habitat into pieces or fragments it, unless the entire habitat is lost (Reid et al., 2013). When a linear feature is built in a rangeland (a road or a railway, for example), the principal process initiated is fragmentation, not loss or modification. Although very little of the landscape is lost or modified (under the road or rail bed), various species of animals (e.g. elephant) will change their behaviour and movement patterns because of the traffic on a road or rail (Barnes et al., 1991). Thus, the minor loss of habitat under the road or rail can cause modification and fragmentation of much of the surrounding habitat. The damages may be imagined if the destruction of landscape is of high magnitude.

Where pastoral (or at least livestock) interests are influential with government, as in Central Asia, Australia and parts of the New World, powerful administrative structures are established to prevent encroachment (Blench & Sommer, 1999). Otherwise, nowhere in the world do foraging peoples have the power to prevent their land being alienated (Blench, 1999); if they have survived until now it is only because of their remoteness (Blench & Sommer, 1999). They also articulate that the foragers and pastoralists often live in overlapping territories, especially in Africa and Siberia. Prior to the 20th century, the land competition was not that intense and hence the two interlocking subsistence strategies could effectively co-exist. Today, the trend is reverse. With the increased human population densities and conversion of rangelands into other land uses, the pastoralists are under pressure to define their territories (Blench & Sommer, 1999). For example, in Siberia, the system of managing wild reindeer was transformed into a system of herding within bound and fenced territories, thereby excluding Nenets hunting peoples. The Nenets were sedentarized. Similarly, the Kgalagadi, Herero and Ovimbundu herders in Botswana and Namibia were excluded by white people owned fenced ranches. As a consequence, they have been pushed into further incursions on the hunting territories of the Khoisan.

6. Moratorium to Nomadic Pastoralism and Rangeland-Based Economy

In preceding sections, it is well articulated that rangelands are the most ancient sources of subsistence economy in human history, and pastoral communities, especially nomadic pastoralists, are considered most sustainable societies in the world. However, in most countries, rangelands are chiefly owned or controlled by governments with little recognition of communal tenures of agro-pastoral communities and their custodianship of local governance institutions. In large number of countries, a substantial area of rangelands has been privatized and managed by ranchers.

Despite awareness of the critical roles of rangelands in sustaining livelihoods of agro-pastoralists and ecological safeguarding, rangelands have felt the pressure of habitat fragmentation, land use change, industrialization, enclosure, privatization, militarization, and ecosystem devastation. The recent phenomenon of land grabbing has also affected the remaining rangelands and dependent pastoralism. Gradually, rangelands are being converted into other land uses or enclosed for exclusive uses under various national laws or policies. Worldwide, there is a common trend of declaring rangelands as wasteland or under-productive lands. In such context, pastoralism is often viewed as outdated and obsolete mode of food and agriculture production to give space for more intensive mode of agro-businesses. Thereafter, with the help of weak rangeland or pastures related laws/policies and by using powerful land acquisition or conversion laws/policies, countries either have given up massive rangeland territories to other forms of land uses or enclosed tenures or have restricted/ circumvented the grazing activities of pastoralist herders. Thus, by changing land use criteria, the results have been the exclusion of local herder communities, fragmentation of habitats, militarization of territories, and enclosure of rangelands. This has affected the sustainability of both rangeland ecosystem services and viable pastoralism and transhumance.

Recently several studies have been undertaken to demonstrate that the nomadic pastoralist way (on rangelands) of livestock production with hardly any economic investment produces some of the most nutritive foods as well as other sustainable products (Galaty & Johnson, 1990; Homewood., 2009; Spooner, 1973; UNOCHA, 2007). But despite such increasing evidence on the value of nomadic pastoralism, the dominant trend is to support intensive agro-business mode of development, even on fragile environment such as rangelands. Moreover, nomadic grazing (which is helpful to biodiversity, not detrimental) is often perceived by ecologists and conservationists as a threat to conservation. Many conservationists have advocated against grazing in natural ecosystems, especially in protected areas. This combination of market forces (agribusiness) and conservation (protected areas) has led to a dramatic loss of access to rangelands for pastoralists.

7. Case of Hutsul Shepherd Communities of Ukraine

Ukrainian side of the Carpathian Mountains is home to about 20,000-25,000 people. In this region, settlement of Hutsuls occupy the eastern part of the Ukrainian Carpathians: present day Verhovyna, Kosiv, southern part of Nadvirna and Bogorodchany districts of Ivano-Frankivsk oblast, adjacent Putyla and southern part of Vyzhnytsky and Storozhynets areas of Chernivtsi regions, and Rakhiv area of Transcarpathian regions. Livestock plays main role in Hutsul subsistence economy. They rear sheep, goats, horses, and dogs. The culture Polonyny (alpine meadows) economy has developed with a typical house types, forms of pastures, production functions of life, ways of processing of milk, making cheese and so on. In 1918, the territory of Yasinia had briefly appeared as Hutsul Republic. Hutsuls fought against the Hungary takeover. But, Romanian army in a battle defeated Hutsuls and captured Yasinia in 1919, and hence Hutsul Republic ended. The population of Hutsuls in Ukrainian territories continued to remain Ukrainians until today.

After the collapse of the Soviet Union and gaining independence in 1991, Ukraine underwent several significant reforms on privatisation and decentralisation, as well as the de-collectivisation of collective and state-owned farms. In 1992, there were 9350 collective farms (kolkhozes) and 4659 State-owned farms (sovkhozes) in Ukraine. Following the land reform in the country, the Land Code of Ukraine 2001 (amended 2017) recognizes three types of agricultural lands: corporate farms [17500 companies occupying 60% of agriculture land], peasant farms [43000 farms covering only 8% agriculture land] and household plots [5.3 million subsistence plots cover 30% agriculture land].

Like other former USSR nations, such as Kyrgyzstan, Kazakhstan, Uzbekistan, Mongolia, etc., Ukraine's land laws have not recognized "community tenures" on common land resources, and hence not adopted any "*community-based pasture management system*". In Kyrgyzstan, for example, responsibility and control over all types of pastures were delegated to a newly established institution: 'Pasture Users Associations' (PUAs) under Law of the Kyrgyz Republic no. 30 "On pastures" 2009 (Isaeva and Shigaeva, 2017). Such community institutions are mandated to take decisions that would be participatory and inclusive, with the intention that such decision-making mode would lead to greater equality in access to pastures and consequently to optimal stocking rates on different pastures (Crewett, 2015; Dorre, 2015; Shigaeva et al., 2016). Although such elaborate legitimate systems have not evolved in Ukrainian agrarian laws, yet Hutsul herders' autonomy in pasture management increased significantly, following the dissolution of collective farms in Ukraine. Now Hutsul shepherds can choose numbers and the kinds of animals to collect from fellow villagers (in the case of hired herders); thus, their wage depends on the number of animals collected and their communication skills to negotiate favourable terms. But the legal provisions do not exist providing the communities autonomy and power to govern the grazing lands, alpine meadows and other collective territories. Hutsul community in Carpathian mountains of Ukraine, like many other

pastoral people in the world, is deprived of communal tenure of grazing lands, which are *de facto* managed collectively with no *de jure* rights on such rangeland commons.

8. Inequality in Policy & Law Making for Mobile Pastoralists

Let alone the autocratic systems, the democratic States also function in the larger interests of haves and powerful economic/social groups. Undeniably, a State is formed from acquiring public resources. The political system, custodian of State, needs resources and revenues required to acquire political dominance in a democracy, particularly. Although the political dominance (through elected majority) comes from the votes of haves not and weaker constituencies, yet the political system works chiefly for the vested interests of haves and powerful groups simply because the largest share of revenue comes from those organized actors (refer to the diagrammatic expression in Figure 1). However, certain social or economic groups organize themselves, get mobilized, and assert to influence the policy/law making institutions. But, the marginalized, weak and less-represented social groups, who are not organized and have least/fragmented voting power, are excluded or disenfranchised in the political and policy processes. This phenomenon is proposed to be examined explicitly in particular case of mobile pastoralist groups.

The nomadic people have faced and been facing gross marginalization, deprivation, discrimination and dispossession. Policy and law making process at international, regional and national levels has ever neglected and excluded mobile pastoralists. Wherever the grazing commons are included in agriculture or rangeland policies, still an “inequality” sounds high. Policy making process in pastoral development continues to be hampered by 1) the dominance by mainstream commercial groups, 2) prevalent biases, and 3) knowledge barriers. The figure 1 depicts that the powerful commercial lobbies having economic interests in rangeland resources (demanding for their projects like mining, tourism, ranching, hydropower, forestry, agriculture, etc.) have not only influenced the policy making institutions but also have occupied entire policy & legal space, mostly in their favour.

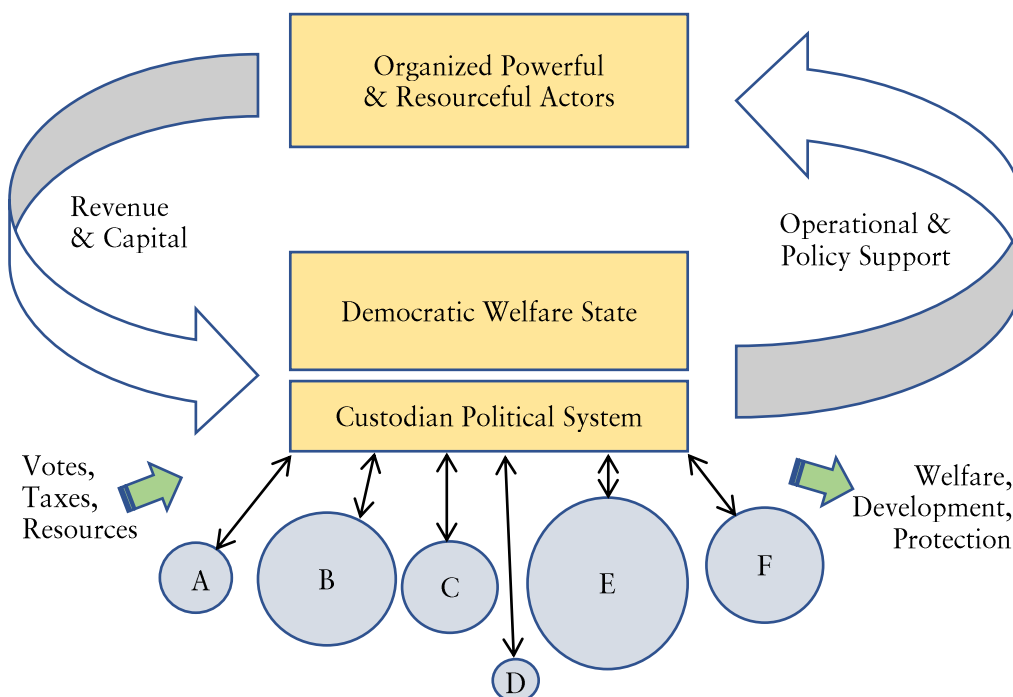

Figure 1

The livelihoods of pastoralists depend on the grazing commons (rangelands) through their livestock grazing. But, commercial demands of rangelands triggered its land use change, being privatized, converted to cultivated lands, reserved for nature conservation, leased for mining and oil extraction, used for governments' mega-projects, or made inaccessible through artificial enclosures. Additionally, rangeland resources are restricted or circumvented for the grazing activities of pastoralist herders. The following "inequalities in policy processes" in context of mobile pastoralist communities worldwide are observed:

- 1) Disenfranchising and depriving the weak and economically poor;
- 2) Subscribing the deep ecologists and green missionaries who portray pastoralism as enemy of ecology (inherent enclosure paradigm);
- 3) States responding to market and powerful commercial lobbies demanding rangeland resources (grasslands, meadows, ranches, forests, etc.);
- 4) Competing commercial lobbies are stronger with massive inputs of capital and power, and they succeed in acquiring common lands for industrial agriculture, mining, energy projects, tourism, oil & gas exploration, etc.;
- 5) Most of the policies tend to be against mobile pastoralists' existence, coupled with infringement of pastoralists' customary rights and enclosure of grazing commons;
- 6) Whereas many politically active communities bargain and assert for their rights' inclusion in policy processes, the mobile pastoralist groups still remain marginalized and alienated from the inclusion;
- 7) Lack of organization/institutionalization, poor mobilization and weak representation of mobile pastoralists are responsible for their persisting exclusion;
- 8) Least population size and demographic decline among the pastoralist communities lead to their insignificant voting power (with lack of negotiation);
- 9) Unequal laws and policy making brings about disastrous effects not only on the affected people but also on the Earth's resources and countries' development.

Above analysis elucidates that the policy and legal space is filled by the powerful actors who not only push behind the weak and excluded groups from policy considerations but also succeed in grabbing and controlling the commons or public resources.

9. Restructuring the Policy Paradigm of Rangeland Commons

Indisputably, resilience of pastoralist communities to the changing environments – ecological, economic and political – has great potential for protecting and conserving the rangeland landscapes or waterscapes. Though varied aspects of pastoralists' resilience have been documented mostly in context of climate change, resilience of nomadic pastoralists needs particularly to be studied and established in respect to drying water sources, changing vegetation composition, reducing fodder resources, degrading rangeland ecosystem, changing political or policy environment, militarization of rangelands, and alike. Certainly, the scientific studies of pastoralists' resilience and adaptation abilities would contribute to inclusive policy processes or reform meant for landscape conservation and management.

Beyond the question of resilience of pastoralism, documented scientific evidences will help minimize effects of policies and laws posing threats to the livelihoods and cultures of pastoralist communities and rangeland ecosystems by providing the data necessary to make informed decisions. This may reverse the trend of underestimating the value of rangeland ecosystems and pastoralist livelihoods by governance structures/bodies world over. But the bigger question is: what is the alternative paradigm, and how can the paradigm shift be realized?

Important is to examine built-in bias that lead to the general perception that rangeland ecosystems are unproductive or under-productive economically, though the ecological services of such ecosystems are not taken into account nor the economic production of the areas despite the lack of economic investment. The resilience of nomadic pastoralists and rangeland ecosystems to the changing environmental conditions need to be specifically addressed to gauge the advantages of conserving and preserving the rangelands and pastoralism together. It needs to be analyzed how the fragmentation, land use change and enclosure of rangelands physically or politically have accrued the economic, ecological and social losses, especially affecting the livelihoods of agro-pastoralists. Doing so will help compare the economic, social and environmental gains obtained from conserved rangeland ecosystems and pastoralism, and from converted/enclosed/ fragmented rangelands (including other land use). It is expected to build strong case for pursuing inclusive policies of conserving the landscapes integrating rangelands and pastoralism as sustainable livelihood practice.

A comprehensive analysis on the meaning of nomadism and semi-nomadic uses of the rangeland is also necessary. Whilst lot of analysis on pastoralism is starting to emerge, there is usually a lack of analysis on the extent to which such pastoralism is still undertaken in a nomadic form or whether semi-sedentary forms of pastoralism are now dominant. Another important aspect that needs to be analyzed would be built-in biases concerning the lifestyles of nomadic pastoralists and their symbiosis with rangelands. It should be tested through scientific evidence whether or not the livelihood and lifestyle of pastoralists are productive at par the neighbouring farmers.

A critical review of the national agrarian laws or conservation laws or local governance laws or pastoral policies is essential. In some countries, well-structured government authorities manage the range systems and grazing affairs, while other countries lack proper governance systems around the pastoral lands despite related policies or laws in place. Along with many Asian countries (e.g. India, Iran, Kyrgyzstan, Uzbekistan, Kazakhstan, Tajikistan, Afghanistan, Mongolia, Tibet, Siberia), the Eastern Europe should review and revise their pertinent laws, policies and governance frameworks for locating the strong loci and weak dots in relation to rangeland sustainability and pastoral grazing.

Paradigm shift is required not only for academics or government, but it is equally need for civil society or citizen groups. In fact, an intensive policy advocacy is required to be launched globally and regionally in support of sustainable pastoralist communities and the rangelands with which they interact. It has direct bearing on the suggested changes in legal/policy frameworks of various countries, as the national governments are guided and advised by international frameworks if such instruments are in place and enacted. Unfortunately, there is seldom any global policy or governance framework meant to advise nations for conserving, preserving and managing rangelands sustainably with rightful existence for pastoral grazing. So, draft global governance on rangelands and pastoralism should be prepared and available in the public domain. Another critical concern is the inclusion of weakest sections of mobile pastoralists in the policy and law making processes, which are otherwise dominantly occupied by powerful actors. Worldwide movement building up around the International Year of Rangelands and Pastoralists 2026 (IYRP) will have profound impact on the rangeland policy processes across nations globally.

10. Conclusion

Subsistence pastoralism is sustainable strategy of livelihood and ecosystem conservation in the rangelands. By means of changing land use, exclusion of indigenous herder communities, fragmentation of habitats and militarization of territories, the enclosure of rangelands has affected the sustainability of both the rangeland ecosystem services and viable pastoralism and transhumance ways of subsistence

livelihood. Resilience of indigenous pastoralist communities to the changing environments – ecological, economic and political – has great potential to protecting and conserving the rangeland landscapes or waterscapes. International and national policy frameworks are essential to enable the survival of rangeland ecology and economy. Viewing the fact that such frameworks do not largely exist, a shift in paradigm and policy frameworks would contribute to protection of rangelands and pastoralist communities. In this direction, an international legal framework would be most fruitful that may coordinate the domestic laws and policies regarding rangeland protection and management. Yet, an adequate inclusion of pastoralist groups in national policy and legal processes is the grey area to be addressed by all concerned States. International Year of Rangelands and Pastoralists 2026 is supposed to have significant impact in this direction.

Author's Declarations and Essential Ethical Compliances

Author's Contributions (in accordance with ICMJE criteria for authorship)

This article is 100% contributed by the sole author. He conceived and designed the research or analysis, collected the data, contributed to data analysis & interpretation, wrote the article, performed critical revision of the article/paper, edited the article, and supervised and administered the field work.

Funding

No funding was available for the research conducted for and writing of this paper. Therefore, acknowledging any support agency is not applicable in case of this research or the written work. However, informal support of institutional supervisors, colleagues and respondents is duly acknowledged.

Research involving human bodies or organs or tissues (Helsinki Declaration)

The author(s) solemnly declare(s) that this research has not involved any human subject (body or organs) for experimentation. It was not a clinical research. The contexts of human population/participation were only indirectly covered through literature review. Therefore, an Ethical Clearance (from a Committee or Authority) or ethical obligation of Helsinki Declaration does not apply in cases of this study or written work.

Research involving animals (ARRIVE Checklist)

The author(s) solemnly declare(s) that this research has not involved any animal subject (body or organs) for experimentation. The research was not based on laboratory experiment involving any kind of animal. Some contexts of animals are also indirectly covered through literature review. Therefore, an Ethical Clearance (from a Committee or Authority) does not apply in cases of this study or written work.

Research on Indigenous Peoples and/or Traditional Knowledge

The author(s) solemnly declare(s) that this research has not involved Indigenous Peoples as participants or respondents, with the documentation of their Indigenous Knowledge. Some other contexts of Indigenous Peoples or Indigenous Knowledge are only indirectly covered through literature review. An Ethical Clearance 'to conduct research on indigenous peoples' Indigenous knowledge is also not relevant. Therefore, an Ethical Clearance (from a Committee or Authority) or prior informed consent (PIC) of the respondents or Self-Declaration in this regard does not apply in cases of this study or written work.

Research involving Plants

The author(s) solemnly declare(s) that this research has not involved the plants for experiment or field studies. The contexts of plants were only indirectly covered through literature review. Thus, during this research the author(s) obeyed the principles of the Convention on Biological Diversity and the Convention on the Trade in Endangered Species of Wild Fauna and Flora.

(Optional) Research Involving Local Community Participants (Non-Indigenous)

The author(s) solemnly declare(s) that this research has not involved local community participants or respondents belonging to non-Indigenous peoples. Yet, this study did not involve any child in any form directly. The contexts of different humans, people, populations, men/women/children and ethnic people are also indirectly covered through literature review. Besides, my research focussed on herders' perception and practices, without resulting in any information of value for marketing purposes. Therefore, an Ethical Clearance (from a Committee or Authority) or prior informed consent (PIC) of the respondents or Self-Declaration in this regard does not apply in cases of this study or written work.

(Optional) PRISMA (Preferred Reporting Items for Systematic Reviews and Meta-Analyses)
The author(s) has/have NOT complied with PRISMA standards. It is not relevant in case of this study or written work.

Competing Interests/Conflict of Interest

Author(s) has/have no competing financial, professional, or personal interests from other parties or in publishing this manuscript. There is no conflict of interest with the publisher or the editorial team or the reviewers.

Attribution and Representation

All opinions and mistakes are the author(s)' own and cannot be attributed to the institutions they represent. The publisher is also not responsible either for such opinions and mistakes in the text or graphs or images.

Rights and Permissions

Open Access. This article is licensed under a Creative Commons Attribution 4.0 International License, which permits use, sharing, adaptation, distribution and reproduction in any medium or format, as long as you give appropriate credit to the original author(s) and the source, provide a link to the Creative Commons license, and indicate if changes were made.
